Story
How I work
Principles

Product Designer

Curious, and not one to give up easily. I keep looking for a way through, from the first research to working code.

I was born in 2001 in the Peruvian Andes and grew up between countries and languages, which taught me to ask why things work the way they do before trying to change them. Today I bring that to product design, end to end: from understanding people and the business, to strategy, interface and working code, whatever shape the problem takes. My test for any design is simple: does it make things clearer for the people who use it? And yes, my parents did kind of make up my name.

Test early, learn faster

Think
Frame the problem and what to test, from user research.

Make
Prototype early in code, often with AI, to test rather than debate.

Check
Test with real users and refine until it's ready to build.

Focus

A screen earns its place when it makes the next step obvious. Everything else goes one level down.

Prototyping

A working prototype settles in a day what a meeting argues about for a week.

Documentation

Decisions, trade-offs and the reasons behind them get written down while the work happens. It keeps everyone aligned, makes handovers fast and saves the team from rebuilding context later.

Continuity

Good work outlives the people who made it: components, rules and docs that keep running whoever joins or leaves the team.

Learnings

Fleet Connect

Turning 100+ indicators into a savings-first dashboard.

2026 Product Design Data Visualisation Mobility

Overview

I kept all 100+ indicators and split them into two priority tiers.

Trade-off
Keeping all 100+ indicators made the tier-2 views denser and the filter logic heavier.

Status
One prototype handed over to the client; I don't know whether it reached production.

Client	Role	Team	Date
Fleet management company	Product Designer	Senior Manager, Strategy Consultant and Product Designer	February 2026

Challenge

The company's deep expertise in mobility and access to extensive operational data should have enabled clients to manage their fleets with confidence. However, as the volume and complexity of information grew, Fleet Connect dashboards became increasingly difficult to navigate, often perceived as a "sea of numbers" rather than a tool for decision-making.

At the heart of the challenge was information overload. Users were presented with hundreds of metrics and indicators, making it difficult to identify priorities, understand performance and act with confidence. The problem was not a lack of data, but the inability to distinguish what truly mattered.

Approach

Listen to users

Qualitative conversations with internal stakeholders showed how different teams used the dashboards, where friction emerged and how insights fed day-to-day operations.

Learn from the best

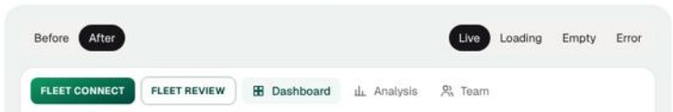

A benchmark of leading products in mobility, logistics and other data-intensive industries showed how the best platforms surface critical signals instead of adding more information.

Prioritise, don't remove

Instead of removing data, we kept the full set and defined two levels of prioritisation, so users focus first on the metrics with the greatest operational impact.

Solution

This reframing turned the dashboard from a reporting tool into a decision-support system, designed around clarity, actionability and business value.

Challenge

The company's deep expertise in mobility and access to extensive operational data should have enabled clients to manage their fleets with confidence. However, as the volume and complexity of information grew, Fleet Connect dashboards became increasingly difficult to navigate, often perceived as a "sea of numbers" rather than a tool for decision-making.

At the heart of the challenge was information overload. Users were presented with hundreds of metrics and indicators, making it difficult to identify priorities, understand performance and act with confidence. The problem was not a lack of data, but the inability to distinguish what truly mattered.

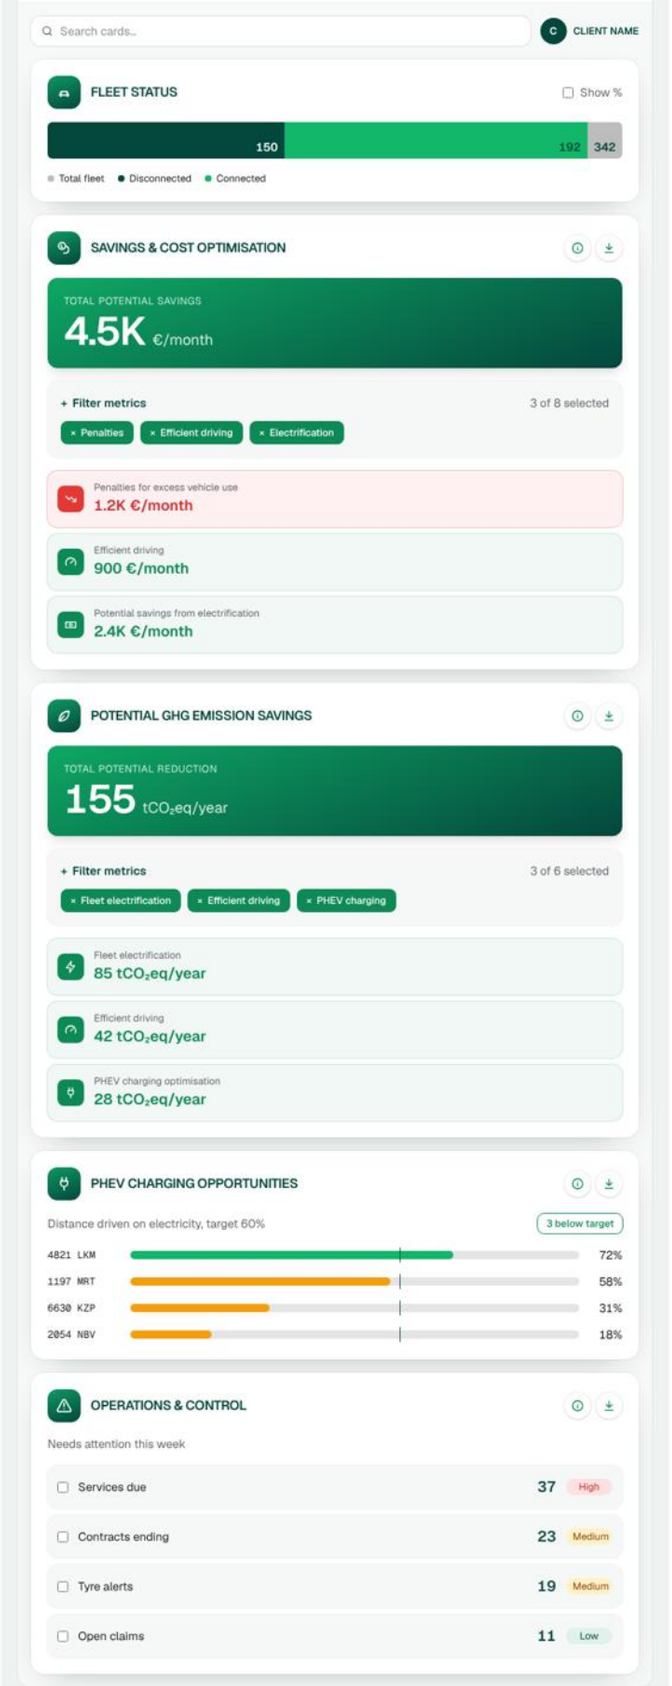

Approach

Listen to users

Qualitative conversations with internal stakeholders showed how different teams used the dashboards, where friction emerged and how insights fed day-to-day operations.

Learn from the best

A benchmark of leading products in

Try it: remove a metric, add one back, remove them all, or search for a card.

The original dashboards were made in Figma Make: I prompted each change and adjusted details by hand when the output wasn't right. This rebuild, made in Claude Code with sample data, puts the filter interactions in code, because the states mattered more than the layout.

Open the prototype full screen →

Case	What happens	In the prototype
Live	Headline total and its metrics, from the selected filters.	Switchable state
Loading	Skeletons in place of numbers, so the layout doesn't jump when data arrives.	Switchable state
Empty	No metrics selected: say so, and point to the filter instead of showing 0.	Switchable state
Error	The card says what failed, that nothing is lost, and offers a retry.	Switchable state
A metric costs money	Penalties show in red, so a cost never reads as a saving.	Handled
Every metric selected	The add control turns off; there's nothing left to add.	Handled
Long labels	Chips use short names; full names truncate in rows and wrap in titles.	Handled
Search with no	A message replaces the cards instead of a blank screen.	Handled

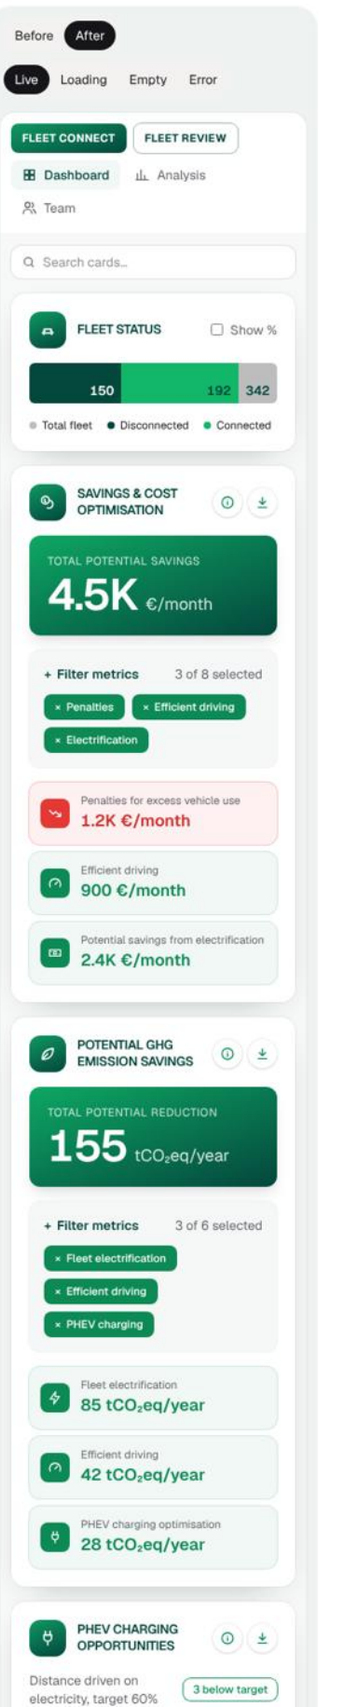

mobility, logistics and other data-intensive industries showed how the best platforms surface critical signals instead of adding more information.

Prioritise, don't remove

Instead of removing data, we kept the full set and defined two levels of prioritisation, so users focus first on the metrics with the greatest operational impact.

Solution

This reframing turned the dashboard from a reporting tool into a decision-support system, designed around clarity, actionability and business value.

matches		
Narrow screens	Cards reflow to one column; nothing overflows at 360px.	Handled
Partial data	Some metrics fail: keep the total, flag what's missing from it.	Next iteration
Stale data	Show when the numbers were last updated.	Next iteration
No permission	Explain who can grant access instead of hiding the card.	Next iteration
Slow network	After a few seconds, keep the skeleton and offer a retry.	Next iteration

Before designing the screens, I used Figma Make's AI to list every state a card could reach, generated each one by prompt and fixed by hand what it got wrong. For this coded rebuild I repeated the exercise with Claude: 4 states made it in as switchable states (live, loading, empty, error), 5 edge cases are handled, and 4 are queued for the next iteration.

Savings first: one headline number, with the levers behind it a filter away.

Fleet status at a glance: connected and disconnected vehicles in a single bar.

Results

The project delivered a high-fidelity dashboard prototype that showed how complex mobility and operational data could become clear, actionable insights for both clients and internal teams. We also mapped and prioritised over 100 performance indicators, creating a scalable foundation for the evolution of Fleet Connect.

Beyond the dashboards, the work defined six strategic internal use cases showing how connected data could unlock value across the organisation. Sharing the vision and recommendations with stakeholders set a clear direction for a more connected, intuitive and insight-driven ecosystem, and a foundation for future development within Fleet Connect.

Learnings

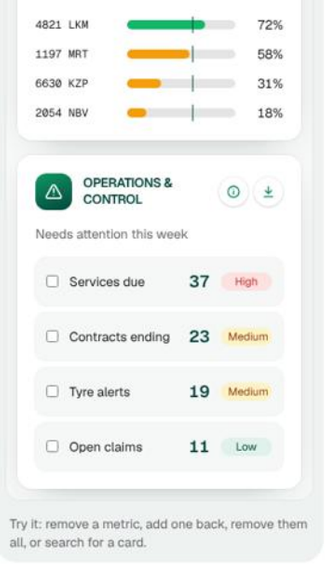

This was one of my first projects prototyping with AI. I built the dashboards in Figma Make, which let us explore and test layouts far faster than designing every screen by hand.

It's also where I learned that AI doesn't keep consistency on its own. Each new generation drifted in components, spacing and how numbers were shown, so I had to set the rules first and check every output against them. AI speeds up the making; the system and the judgement still come from the designer.

Service & Experience Design

Clarifying and aligning services across a growing organisation.

2025 | Service Design | Strategy

Overview

Before crafting a single screen of the digital product, I mapped every service end to end.

Trade-off
Months of mapping before anything visible shipped.

Status
The redesigned website launched, giving the services a clear front door; the service maps stay as a blueprint the team can grow into.

Client	Role	Team	Date
Growing organisation, B2B and B2C	Strategic Service Designer	Solo, working with the talent and sales teams	January to June 2025

Challenge

The organisation worked across multiple services and touchpoints, serving both B2B and B2C audiences. Its offering, services and supporting processes had evolved organically over time, which led to fragmented experiences, duplicated effort and misalignment between customer needs, internal operations and communication.

The core challenge was misalignment: services were not always structured around real user needs, internal processes were inconsistently documented, and communication varied across channels and teams. The goal was to understand how services were really experienced end to end, and to bring greater coherence to processes, communication and delivery.

Approach

Map services and experiences

Journey maps made customer and employee experiences visible across key services, so pain points, inefficiencies and moments of friction were shared by every stakeholder.

Redesign services and processes

Existing services and internal workflows were reviewed and restructured to align with user needs and business objectives, improving clarity, efficiency and consistency.

Streamline and document processes

Business processes were documented and simplified to reduce ambiguity, support smoother collaboration and give teams a clearer operational baseline.

Align communication and visuals

Visual and written materials were developed so services were clearly and consistently articulated across internal and external channels.

Work across teams

The work was carried out with multiple teams to build shared understanding, consistent messaging and alignment between service intent and execution.

Monitor and evolve

Services and communication strategies were treated as evolving systems, monitored and adapted over time to improve engagement, relevance and satisfaction.

Client	Role	Team	Date
Growing organisation, B2B and B2C	Strategic Service Designer	Solo, working with the talent and sales teams	January to June 2025

Challenge

The organisation worked across multiple services and touchpoints, serving both B2B and B2C audiences. Its offering, services and supporting processes had evolved organically over time, which led to fragmented experiences, duplicated effort and misalignment between customer needs, internal operations and communication.

The core challenge was misalignment: services were not always structured around real user needs, internal processes were inconsistently documented, and communication varied across channels and teams. The goal was to understand how services were really experienced end to end, and to bring greater coherence to processes, communication and delivery.

Approach

Map services and experiences

Journey maps made customer and employee experiences visible across key services, so pain points, inefficiencies and moments of friction were shared by every stakeholder.

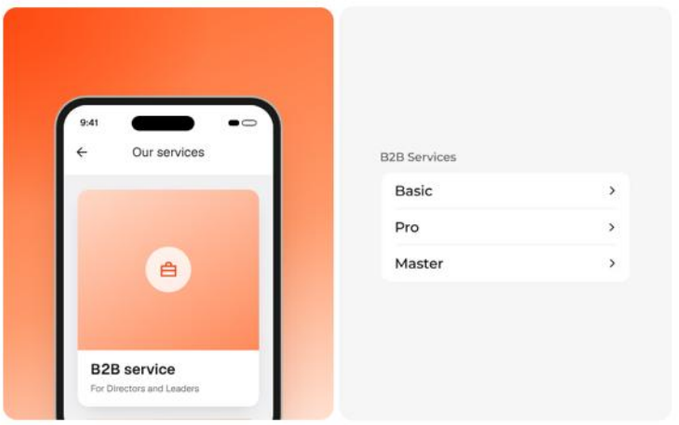

Redesign services and processes

Solution

Rather than fixing isolated touchpoints or delivering a single fixed solution, the work looked at services as a whole and built shared understanding and structures that enable ongoing improvement.

Four ideas guided the work: coherence, structure, clarity and alignment.

Each service gets one clear way in, with simple tiers behind it.

Clearer services and better experiences,
designed from the inside out.

Results

The work progressed to a formal rollout, with a redesigned website that presents the services clearly.

- Launched a redesigned website that presents the services clearly.
- Shaped the two core services, defining what each one offers and who it is for.
- Mapped how sales meets new clients and hands them on to the service team.
- Gave a structured view of services and journeys that had never been documented.
- Mapped the journeys for a planned community, ready for when the firm moves it forward.

Learnings

This is where I learned how service design really works: how a business runs, how clients come in, and how a service comes to life behind every screen.

Next project

Learnings

Innohub

Igniting innovation participation.

2026 | Experience Design | Innovation Strategy | Design Research

Overview

I designed participation around three employee archetypes and community maturity levels.

Trade-off
More to set up and govern than a single platform.

Status
Handed over in June 2026 and in use by the client today; it's too early to share KPIs.

Client	Role	Team	Date
Leading Spanish insurer, 100+ years old	Product Designer	Growth strategy, design research, product design and visual design	March to June 2026

Challenge

The corporate innovation team wanted to strengthen innovation as a shared capability across the organisation. They were already driving new initiatives and engaging employees, but embedding innovation practices beyond dedicated teams remained a key challenge. Ideas also needed stronger alignment with business needs, and more buy-in from stakeholders, to reach their full impact.

Generating ideas is only one part of the innovation journey. As organisations mature, the challenge shifts from collecting ideas to turning them into meaningful outcomes: ideas must align with business priorities, be validated with stakeholders and connect to clear paths to implementation.

Approach

Research both sides

Internal and external research shaped personas and journeys for employees and for external collaborators, finding the key moments where innovation could fit into their work.

Design the rules

Beyond the digital platforms, we defined the participation mechanisms and governance principles needed to keep ideas coming over time.

Tailor participation

Three employee archetypes and community maturity levels let the experience meet people where they are, from first-time contributors to regulars.

Open up to partners

An external collaboration experience connected talent, knowledge and strategic partners through clear roles and participation journeys.

Validate with the team

Ideation and validation workshops let us test, refine and challenge ideas continuously, so every concept answered a real business need.

Speak their language

Working closely with the innovation team kept the experience aligned with the organisation's own innovation language and culture.

Status
Handed over in June 2026 and in use by the client today; it's too early to share KPIs.

Client: Leading Spanish insurer, 100+ years old
Role: Product Designer
Team: Growth strategy, design research, product design and visual design
Date: March to June 2026

Challenge

The corporate innovation team wanted to strengthen innovation as a shared capability across the organisation. They were already driving new initiatives and engaging employees, but embedding innovation practices beyond dedicated teams remained a key challenge. Ideas also needed stronger alignment with business needs, and more buy-in from stakeholders, to reach their full impact.

Generating ideas is only one part of the innovation journey. As organisations mature, the challenge shifts from collecting ideas to turning them into meaningful outcomes: ideas must align with business priorities, be validated with stakeholders and connect to clear paths to implementation.

Approach

Research both sides
Internal and external research shaped personas and journeys for employees and for external collaborators, finding the key moments where innovation could fit into their work.

Design the rules
Beyond the digital platforms, we defined

Solution

We designed an innovation experience that empowers employees to contribute to the company's future: a shared innovation model, with the experience and platforms behind it, that lets ideas be generated and developed across business units and brands, plus a vision for an external ecosystem around them.

Ideation and validation workshops with the client's team: where ideas were tested, refined and challenged.

One of the innovation lines explored with employees: ideas for families, across generations.

Innovation must become a shared capability across the business.
From specialists to everyone, from isolated ideas to insight-led opportunities, from sporadic workshops to everyday practice.

Results

Together, these initiatives gave the client a more structured and scalable innovation model, focused on driving business impact.

- A shared innovation model for every business unit and brand, with the experience and platforms to run it.
- Three employee archetypes and community maturity levels to tailor participation.
- A vision for an external ecosystem, with user profiles, journeys and a platform roadmap.
- Participation mechanisms and governance principles to sustain ideas over time.
- Concepts refined with the client's team and aligned with real business needs.

Learnings

The validation workshops were the most valuable part of the project. Testing, refining and challenging ideas with the team kept every concept tied to real business needs and built alignment around the opportunities with the greatest potential.

That open, iterative dialogue turned early thinking into stronger solutions, and made innovation a truly collaborative effort.

Next project

the participation mechanisms and governance principles needed to keep ideas coming over time.

Tailor participation

Three employee archetypes and community maturity levels let the experience meet people where they are, from first-time contributors to regulars.

Open up to partners

An external collaboration experience connected talent, knowledge and strategic partners through clear roles and participation journeys.

Validate with the team

Ideation and validation workshops let us test, refine and challenge ideas continuously, so every concept answered a real business need.

Speak their language

Working closely with the innovation team kept the experience aligned with the organisation's own innovation language and culture.

Solution

We designed an innovation experience that empowers employees to contribute to the company's future: a shared innovation model, with the experience and platforms behind it, that lets ideas be generated and developed across business units and brands, plus a vision for an external ecosystem around them.

Ideation and validation workshops with the client's team: where ideas were tested, refined and challenged.

One of the innovation lines explored with employees: ideas for families, across generations.

Innovation must become a shared capability across the business.
From specialists to everyone, from isolated ideas to insight-led opportunities, from sporadic workshops to everyday practice.

Results

Together, these initiatives gave the client a more structured and scalable innovation model, focused on driving business impact.

- A shared innovation model for every business unit and brand, with the experience and platforms to run it.

Design Ops & Strategy

Bringing structure to work under pressure.

Three employee archetypes and community maturity levels to tailor participation.

A vision for an external ecosystem, with user profiles, journeys and a platform roadmap.

Participation mechanisms and governance principles to sustain ideas over time.

Concepts refined with the client's team and aligned with real business needs.

Learnings

The validation workshops were the most valuable part of the project. Testing, refining and challenging ideas with the team kept every concept tied to real business needs and built alignment around the opportunities with the greatest potential.

That open, iterative dialogue turned early thinking into stronger solutions, and made innovation a truly collaborative effort.

Design Ops & Strategy

Bringing structure to work under pressure.

2025 Design Ops Strategy

Overview

I added a briefing step and shared complexity levels before work reached designers.

Trade-off
One more step at intake for every request.

Status
Framework handed over in December 2025. The team has since added dedicated project managers; I can't confirm it runs on my framework.

Client	Role	Team	Date
Multidisciplinary organisation	Design Program Manager	A team of 25, working closely with the Director of Operations	September to December 2025

Challenge

Organisations running many client projects in parallel share a common problem: work arrives with varying levels of clarity. Requests may lack defined priorities, clear timelines or complete briefings, creating friction in client relationships and internal workflows. This multidisciplinary team dealt with high ambiguity and constant demand.

At the core was ambiguity: unclear requests, misaligned expectations, emotionally charged interactions with clients, and internal bottlenecks caused by centralised information flow. The goal was to bring structure to how requests were received, understood and managed, while balancing client expectations, team capacity and an evolving vision.

Approach

Structure incoming requests

Raw client demands were translated into clear, actionable briefings before reaching the team, enabling realistic effort estimates and early alignment.

Stabilise client communication

Interactions were reframed towards calm, fact-based responses, avoiding confrontation and setting a minimum line of professional respect.

Introduce project dimensioning

A shared language for levels of complexity and effort made conversations about scope and timelines more realistic.

Rethink the structure

We explored a more distributed and sustainable setup, identifying where centralised coordination created bottlenecks and how shared systems could enable autonomy.

Treat culture as infrastructure

Team rituals and informal practices were recognised as key to cohesion, trust and long-term sustainability.

Challenge

Organisations running many client projects in parallel share a common problem: work arrives with varying levels of clarity. Requests may lack defined priorities, clear timelines or complete briefings, creating friction in client relationships and internal workflows. This multidisciplinary team dealt with high ambiguity and constant demand.

At the core was ambiguity: unclear requests, misaligned expectations, emotionally charged interactions with clients, and internal bottlenecks caused by centralised information flow. The goal was to bring structure to how requests were received, understood and managed, while balancing client expectations, team capacity and an evolving vision.

Approach

Structure incoming requests

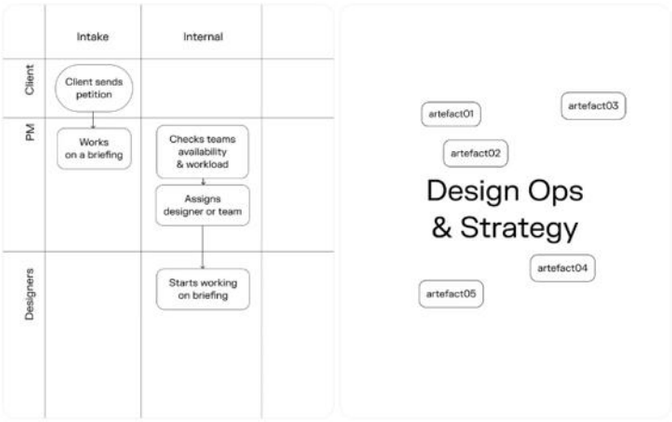

Raw client demands were translated into clear, actionable briefings before reaching the team, enabling realistic effort estimates and early alignment.

Stabilise client communication

Interactions were reframed towards calm, fact-based responses, avoiding confrontation and setting a minimum line of professional respect.

Solution

Rather than implementing a closed or final system, the focus was on setting a direction and creating the conditions for clearer decisions under uncertainty.

The intake flow, from a client's request to a designer starting work, and the artefacts that support it.

The first priority is always to stabilise delivery and protect the team.
In parallel, I observe how work actually happens to design structures that reduce friction over time.

Results

The work gave the team a clearer way to receive, scope and manage projects. The organisation has since moved in the same direction, with dedicated project managers and a defined structure.

- Projects began with clearer alignment and less ambiguity.
- The client accounts I owned stayed stable and under control.
- Scope and effort discussions gained a shared reference framework.
- Organisational bottlenecks were surfaced and made explicit.
- Cultural practices were recognised as strategic assets.

Learnings

Strategic design can work beyond deliverables, shaping how organisations function, communicate and grow in contexts of uncertainty.
